Dependencies for app.py

The script needs **Flask** to generate the web application for the project. **Psycopg2** is used to open the connection to the PostgreSQL database. **Psycopg2.sql** is used to parameterize the SQL statements and reduces the risk of SQL injection. The standard Python library is another dependency that is used to handle the core language and exception handling. Within the **Flask** package there are subnodes that are needed to generate the functioning HTML.
